

meltingpot.io MVP Scope

A collaborative coursework platform where students build, improve, and share course knowledge together. Meltingpot connects to Canvas and Google Classroom, imports course material, and creates a shared study space where student contributions become more useful over time.

Product Goal

Help students turn scattered coursework into a living class knowledge base. Students create the content, while AI helps organize, explain, improve, and study that content.

Core Experience

Students connect a course, import class material, build a student study layer, collaborate through contributions and reviews, and use AI tools to understand and improve their coursework.

Course Structure

Course -> Modules -> Lessons. Official course material stays separate from student-created content. Students can access both through the same lesson workspace.

Dashboard

The home screen shows upcoming deadlines, courses, setup options, uploads, search, recently used items, contribution activity, and streaks.

Student Content

Students upload notes, screenshots, PDFs, images, and resources. AI helps clean and organize material. Students review changes before sharing.

AI Features

AI is central to the experience while students stay in control. Features include: cleaning notes, organizing material, answering course questions, finding missing concepts, creating editable practice questions, catching students up on missed lessons, and helping maintainers review contributions.

Collaboration

Students can copy or fork material while keeping source attribution. Lessons support comments, branches, version history, and review requests. Course creators can add student maintainers.

Access

Courses can be joined through email invites, share links, or generated 6-character codes. LMS connections can help identify classmates.

Calendar and Search

A shared calendar combines deadlines, quizzes, and tests. Search works across lessons, notes, files, resources, and activity.

Contribution Identity

Students build a visible contribution history through a Meltingpot contribution graph, streaks, ranks, contributor profiles, and milestones.

MVP Requirements

Launch includes LMS imports, course structure, uploads, student notes, quizzes, AI tools, calendar, search, forks, attribution, comments, pull requests, maintainers, version history, contribution tracking, streaks, ranks, and profiles.

Deferred Features

Advanced certificates, adaptive learning, school administration, full semester recap exports, and deeper automation are outside the first release.

Success Criteria

A student can connect a class, find their course, upload material, improve it with AI, collaborate with classmates, and see their contribution impact.
